Sequence 593921, Application US/10310914A
Publication No. US20060003322A1
GENERAL INFORMATION:
APPLICANT: Shiler, Kvuzat
TITLE OF INVENTION: Bioinformatically detectable group of novel regulatory genes and
TITLE OF INVENTION: uses thereof
FILE REFERENCE: 06087.0200.CPUS01
CURRENT APPLICATION NUMBER: US/10/310,914A
CURRENT FILING DATE: 2002-12-06
NUMBER OF SEQ ID NOS: 1388402
SOFTWARE: PatentIn version 3.3
SEQ ID NO 593921
LENGTH: 21

   amplification of gibbon interleukin-3 cDNA (see AAV33946) minus the signal sequence. It includes a 5' BamHI site. The primer was used with a reverse primer (see AAV33950) to amplify the gibbon IL3 mature coding region. The PCR product was utilised in the construction of a prokaryotic expression plasmid encoding a fusion between human Fanconi anaemia complementation group C (FAC) protein (see AAW68546) and gibbon IL3 (see AAW68547). This conjugate, or a nucleic acid encoding it, can be used to deliver FAC to a haematopoetic progenitor cell, specifically to inhibit apoptosis, particularly in patients exposed to high doses of chemotherapy for treatment of non-myeloid cancers, also to treat Fanconi anaemia by complementation of the genetic defect
                              Cytostatic; Gene therapy; Vaccine; RNA Interference; cancer; short interfering RNA; gene silencing.
  New conjugate of Fanconi anaemia molecule and peptide selective for haematopoietic precursor cells - inhibits apoptosis of these cells, for treating Fanconi anaemia and patients undergoing high-dose chemotherapy

  ; an antibody specific for a CRTP, or a T cell activated by a CRTP; and (b) a carrier. The pharmaceutical composition may also comprise a polynucleotide capable of inhibiting or decreasing the expression of the CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, C20orf103, CACNAID, CDH6, CST, ENPP3, FLJ11856, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRPM4. The pharmaceutical composition is useful for treating cancer, e.g. colon cancer, lung cancer, breast cancer, prostate cancer, liver cancer, kidney cancer, stomach cancer, and esophageal cancer. The present sequence is a CRTP short interfering RNAS (siRNA) oligonucleotide. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

CC The invention describes a composition comprising a small interfering CC nucleic acid molecule (siNA) capable of reducing expression of a target CC gene that is active in a IgE-mediated disorder, a genetic construct that CC expresses the siNA, and a binding agent that specifically binds to a CC target antigen expressed on the surface of the cell. Also described are: CC amethod for the treatment of an IgE-mediated disorder in a patient; cC prevention of IgE-mediated disorder in a patient; reduction of CC essinophilia in a patient; modulating an IgE-mediated immune response to a specific antigen in a patient; and preventing or reduction of the severity CC of an immune response to a specific antigen in a patient. The composition CC is useful in the preparation of a medicament useful for the treatment of CC urticaria, atopic dermatitis, food allergies, diseases that benefit from CC the reduction of essinophilia in the tissues of the respiratory system, CC or disorders having hypersensitivity immune reaction. This sequence CC represents a sinA for supression of human IgE expression. 21 BP; 7 A; 3 C; 6 G; 5 T; 0 U; 0 Other;

ORCHID BIOSCIENCES INC

New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic

83pp; English

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPB. The present invention includes kits for determining the presence or absence of a SNP, using t

SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or clientity of a SNP and for genotyping nucleic acid samples, for e.g. to casses by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include disease e.g. caused by one or more SNPs. Phenotypic traits include disease, muscular cystrophy, familial hypercholesterolaemia, polycystic kidney disease, conteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial contended in the component is or may be genetic such as autoimmune continuation, cancer, nervous system diseases and infection by pathogenic inflammation, cancer, nervous system diseases investigations and microorganism. The method is also useful in forensic investigations paternity analysis. The present sequence represents a PCR primer spector a human SNP containing DNA sequence oligonucleotides of the invention. The PCR primers are used to amplify a specific

New isolated interfering ribonucleic acid (iRNA) agent comprising a sense sequence and an antisense sequence, useful for treating a human diagnosed as having or at risk for having adult macular degeneration.

Claim SEQ ID NO 84; 200pp; English.

CC synthesis of the iRNA agent, where the sense and antisense atrands CC comprises at least one modification that stabilizes the iRNA agent against CC nucleolytic degradation; a pharmaceutical composition comprising the iRNA cC agent; inhibiting VEGP expression; and treating a human diagnosed with CC adult macular degeneration (AMD), by administering a therapeutically CC effective amount of the iRNA agent. The isolated iRNA agent has the sense CC sequence that differs by no more than 1, 2, or 3 nucleotides from a SEQ CC ID NO: 2-401, not defined in the specification. The iRNA agent further CC comprises a non-nucleotide moiety. The iRNA agent further CC or a second 3'-overhang comprising 1-6 nucleotides. The iRNA agent CC further comprises a phosphorothioate at the first internucleotide linkage CC at the 5' or 3' end of the antisense and sense sequences. The agent CC treating adult macular degeneration, diabetic retinopathy, cancer, asthma agent comprises a condition of the iRNA agent is useful for treating adult macular degeneration, diabetic retinopathy, cancer, asthma comprises a condition of the iRNA agent is useful for treating adult macular degeneration, diabetic retinopathy, cancer, asthma comprises a condition of the iRNA agent is useful for treating adult macular degeneration, diabetic retinopathy. The present invention relates to the use of siRNA targeting vascular endothelial growth factor (VEGF). Specifically claimed is an isolated interfering ribonucleic acid (iRNA) agent comprising a sense sequence an antisense sequence, where the sense and the antisense sequences for an RNA duplex. Also claimed are methods of reducing the amount of VEGF RNA in a cell, using the iRNA agent; making an iRNA agent by the sequence targeting human VEGF form and

   The present invention relates to the use of siRNA targeting vascular CC endothelial growth factor (VEGF). Specifically claimed is an isolated CC interfering ribonucleic acid (iRNA) agent comprising a sense sequence and CC an antisense sequence, where the sense and the antisense sequences form CC an RNA duplex. Also claimed are methods of reducing the amount of VEGF CC RNA in a cell, using the iRNA agent; making an iRNA agent by the CC synthesis of the iRNA agent, where the sense and antisense strands CC comprise at least one modification that stabilizes the iRNA agent against CC cucleolytic degradation; a pharmaceutical composition comprising the iRNA agent; inhibiting VEGF expression; and treating a human diagnosed with CC adult macular degeneration (AMD), by administering a therapeutically CC effective amount of the iRNA agent. The isolated iRNA agent has the sense sequence that differs by no more than 1, 2, or 3 nucleotides from a SEQ CC ID NO: 2-401, not defined in the specification. The iRNA agent further CC comprises a non-nucleotide moiety. The iRNA agent further comprises one or a second 3'-overhang comprising 1-6 nucleotides. The iRNA agent further CC crasting adult macular degeneration, diabetic retinopathy, cancer, asthma CC and angiogenic disorders. The present sequence is short interfering sense cC sequence targeting human VEGF 121.

   CC monodispersed preparation of a polyanionic polymer (PP) larger than 10 CC kD. (M) involves inserting into an expression vector (EV) a ligating content of product formed by ligating together oligonucleotides that encode content for the protein (I) comprising EV in a host cell, and isolating CC the protein product (P) of EV, where (P) is PP and at least 80% of PP is CC approximately of the same molecular weight. Also described: (1) a CC recombinant fusion protein (I) comprising a polyanionic polypeptide at either one end or at both ends of it; (2) a CC polyanionic polymer (II) conjugate comprising a polyanionic polymer and CC comprises a nucleotide sequence encoding a polyanionic polymer and CC comprises a nucleotide sequence, where the polyanionic polymer and CC comprises a nucleotide sequence, where the polyanionic polymer and at comprises a nucleotide sequence, where the polyanionic polymer is CC polyglutamic acid or polyaspartic acid, (4) production of (I); (5) a cell CC (IV) comprising (III) or a vector that comprises a nucleotide sequence that encodes a polyanionic polymer that is larger than 10 kDa; and (6) a recombinantly-produced polyanionic polymer (V) that is of any molecular CC weight or is larger than 10 kD, and is conjugated to another protein. (I) is useful for treating a disease or alment in an individual by caffective amount of a pharmaceutically acrive agent a therapeutic manner of a pharmaceutically acrive agent.

   The invention relates to compounds, compositions and methods for modulating the expression of serine/threonine kinase 16 (also called PKLI2, transforming growth factor-beta-stimulated factor 1; TSP1 and myristylated and palmitylated serine/threonine kinase; MPSK). The composition comprise antisense oligonucleotides targeted to PKLI2 gene. The compound, composition and methods are useful for treating a disease or condition associated with serine/threonine kinase 16, such as a hyperproliferative disorder. They are also useful in research and diagnostics for modulating the expression of serine/threonine kinase 16. The invention is also useful in gene therapy. The present sequence is an antisense oligonucleotide targeted to human serine/threonine kinase 16 DNA. This sequence is used to illustrate the method of the invention.

The specification describes a multifunctional short interfering nucleic acid (siNA). This multifunctional siNA molecule is of two formulae given in the specification. The multifunctional siNA of the invention is useful for modulating RNA function and/or gene expression in a cell. It can be used for down regulating or inhibiting the expression of one or more target nucleic acid molecules. It is also useful for treating diseases or conditions that responds to modulation of gene expression or activity in a cell, tissue, or organism, e.g. organ or tissue transplant, tissue grafting, or treatment of pulmonary disease (restenosis) or preventing neointimal hyperplasia and atherosclerosis in grafts. It can further be used for treating CNS lesions or injury, including treating cued for treating the conditions (e.g. Alzheimer's disease, parkinson's cuedesses, epilepsy, dementia, Huntington's disease, or amyotrophic lateral sclerosis), cancers, infectious diseases, ocular diseases, crardiovascular diseases, prion disease, inflammatory diseases, renal diseases, liver diseases, mitochondrial diseases, sendorned diseases, or reproduction related diseases, and conditions. AEC14610-AEC36614 represent target

   The present invention describes a method of arraying genome clones. The comprises: (a) clones of the genomic libraries contained in cmultiwell plates numbered for discrimination are mixed in each of the cultiwell plates; (b) a primer designed based on the chromosome marker (c) a signal corresponding to the marker is detected from the resultant (c) a signal corresponding to the marker is detected from the resultant complified product to specify the discrimination Nos. of the multiwell complete containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the marking in the specified discrimination Nos. to array the multiwell complete; (e) the clones in the multiwell plates of the specified complete; (e) the clones in the multiwell plates of the specified complete; (e) the clones in the multiwell plates of the specified complete; (e) the mixed clones are detected from the amplified by using the above primer; (g) signals can disteral directions; (f) the mixed clones are cultured and the complete are specified from the detected result; and (i) the clones in the multiwell complete are specified from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The conformators is useful for gene analysis. ABL42937 to ABL45322 represent PCR primers for human chromosome 21922.1, which are specified for use in the present invention

  CC endothelial growth factor (VEGF). Specifically claimed is an isolated CC interfering ribonucleic acid (iRNA) agent comprising a sense sequence and CC an antisense sequence, where the sense and the antisense sequences form CC an RNA duplex. Also claimed are methods of reducing the amount of VEGF CR NA in a cell, using the iRNA agent making an iRNA agent by the CC synthesis of the iRNA agent; where the sense and antisense strands CC comprise at least one modification that stabilizes the iRNA agent against CC nucleolytic degradation; a pharmaceutical composition comprising the iRNA agent; inhibiting VEGF expression, and treating a human diagnosed with CC adult macular degeneration (AMD), by administering a therapeutically CC effective amount of the iRNA agent. The isolated iRNA agent further CC moprises a non-nucleotide moiety. The isolated iRNA agent further CC comprises a non-nucleotide moiety. The iRNA agent further CC comprises a non-nucleotide moiety. The iRNA agent further CC comprises a non-nucleotide moiety. The iRNA agent further CC comprises a phosphorothioate at the first internucleotide linkage CC at the 5' or 3' end of the antisense and sense sequences. The agent CC treating adult macular degeneration, diabetic retinopathy, cancer, asthma CC and angiogenic disorders. The present sequence is short interfering sense CC semience targeting human VCGF 12'

cancer, hypertension, atherosclerosis, DVX polypeptides and disorder associated 717; 1103pp; English polynucleotides, useful for preventing or treating with aberrant NOVX expression or activity e.g., atherosclerosis, cardiomyopathy or bronchial

This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX13460-ABX13462 and ABX97186-ABX97593 represent PCR primers and probes used in the amplification and isolation of the NOVX polymucleotides represented in ABX97008-ABX97185 which encode the polypeptides represented in ABU65041-ABU65218. The probes described in the invention are modified at the 5'-end by TET and the 3'-end by TAMRA A; 13 C; 2 G; 7 ,, H 0 U; 0 Other;

CC The invention relates to an isolated polypeptide (designated NOVX, or CC NOV1-NOV127) comprising a sequence selected from 178 fully defined amino acid sequences (and their mature forms, variants and fragments). Also CC included are an isolated nucleic acid molecule encoding NOVX, a vector CC comprising the nucleic acid, a cell comprising the vector, methods for determining the presence or amount of the polypeptide or the nucleic acid molecule in a sample, methods for determining the presence of or CC predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian CC subject, a method for identifying an agent that binds to the above polypeptide, a method for identifying a potential therapeutic agent for CC use in the treatment of a pathology that is related to aberrant CC expression or physiological interactions of the polypeptide, a method of screening for a modulator of activity or of latency or predisposition to CC a pathology associated with the polypeptide and a method for modulating CC are useful for diagnosing, preventing or treating diseases such as CC diabetes, obseity, infectious diseases, anorexia, cancer-associated CC diabetes, obseity, infectious diseases, anorexia, cancer-associated CC diabetes, and other chronic diseases. These may also be used in CC parkinson's disease, immune disorders, haematopoietic disorders. The composition and cc pharmacogenomics. The polypeptides are also useful as vaccines. The CC assay tissue specific axpression of a NOVX mRMA.
  Example C; SEQ ID NO 521; 786pp;
  New NOVX polypeptides and nucleic acid molecules useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or

  Talin in human cells or tissues comprising contacting the cells or tissues in vitro with (I) or (a). (I) has antimicrobial, antiminlammatory and cytostatic activities, and can be used in antisense gene therapy and as a Talin expression inhibitor. (I) can be used: to inhibit the expression of human Talin in human cells or tissues; to prevent or delay infection, inflammation or tumour formation; and in diagnostics, therapeutics, prophylaxis, and in research reagents and kits. The present sequence represents a human Talin antisense chimeric phosphorothicate oligonucleotide, having 2'-methoxyethyl (2'-MOE) wings of 5 nucleotides at the 5' and 3' ends and a 10 nucleotide deoxy gap in the middle, which
  The present invention describes an antisense compound (I), 16 to 30 bases in length targeted to specific base regions of a nucleic acid encoding human Talin. Also described: (a) an antisense compound up to 30 bases in length which inhibits the expression of human Talin; (b) a composition length which inhibits the expression of human Talin; (b) a composition (II) or (a); and (c) inhibiting the expression of human (II) comprising (I) or (a); and (c) inhibiting the expression of human (II) comprising (I) or (a); and (c) inhibiting the expression of human (II) comprising (I) or (a); and (c) inhibiting the expression of human (II) comprising (I) or (a); and (c) inhibiting the expression of human (II) comprising (I) or (a); and (c) inhibiting the expression of human (II) comprising (II) or (a); and (c) inhibiting the expression of human (II) comprising (II) or (a); and (c) inhibiting the expression of human (III) comprising (II) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression of human (III) or (a); and (c) inhibiting the expression (III) or

Sequences ADG90460-ADG90539 represent phosphorothioate targeted to the CC human talin gene, which inhibit its expression. The antisense were considered to target different regions of human talin RNA, and were considered to their effect on talin expression by quantitative real-time CC PCR. Talin is a cytoplasmic protein which links cytoskeletal proteins considered to their effect on talin expression by quantitative real-time CC regulation of cellular advisor and cell morphology. Talin is highly considered to the contractill morphology. Talin is highly considered to the contractill morphology. Talin is highly considered to the contractill morphology. Talin is highly considered to the cardiomy a role in platelet adhesion as its conduction as it has been found to confide the contractill force to the extracellular conductions. The expression at myotendinous junctions. The expression of talin is contribute to the development of prostate tissues, a phenomenon known to contribute to the development of prostate tissues, a phenomenon known to contribute to the development of prostate tissues, a phenomenon known to contribute to the development of prostate tissues, a phenomenon to talin is such as those related to cellular adhesion. The coligonucleotide concertation for a particular cell line.

ABQ84461/c
  The present invention describes a new isolated nucleic acid sequence (I) comprising a DPP10 mRNA sequence. DPP10 is a dispeptidyl peptidase (also CK known as prolyloligopeptidase). (I) has antiinflammatory, antiasthmatic, currently of the manufacture of a medicament for regulating before the manufacture of a medicament for regulating DPP10 expression or for preventing or treating inflammatory disease e.g., inflammatory cor for preventing or treating inflammatory disease e.g., inflammatory cor bewel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can be used in an assay for detecting or measuring DPP10 in a sample. A host cell comprising (I) can be used for producing recombinant DPP10 gene products, or in drug screening systems to identify agents for diagnosis or treatment of individuals having or susceptible to inflammatory cor treatment DPP10 is located on chromosome 2, more specifically chromosome 2q14. ABQ84254 to ABQ84612 and ABP55569 to ABP55629 represent of sequences used in the exemplification of the present invention

  The invention relates to novel antisense compounds targeted to a nucleic acid molecule encoding human Talin to and inhibit its expression. The invention is useful for treating a disease or condition associated with Talin such as a disease or condition e.g. muscular, haematologic, cardiac or hyperproliferative disorder such as cancer. The present sequence is ar antisense oilgonucleotide targeted to human Talin DNA.
  New compounds, particularly antisense oligonucleotides targeted to nucleic acid encoding talin, useful for treating muscular, cardiac, hematologic, or hyperproliferative disorders.

   The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic and screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR
   cancer, stomach cancer, and esophageal cancer. The present sequence is a CRTP short interfering RNAs (siRNA) oligonucleotide. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                   S
   CC cells in which both alleles of a gene are modified, comprising modifying CC one allele by insertion or replacement by a cassette having an CC expressible selectable marker and modifying other allele by CC recombination, of a promoter replacement fragment with a heterologous CC promoter, so that expression of the second allele is regulated by the CC promoter. (MI) is useful for constructing a strain of diploid fungal CC cells in which both alleles of a gene are modified. The diploid fungal CC cells in which both alleles modified are useful for identifying a gene that CC is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene CC that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus dasase. (MI) is useful for identifying a compound which modulates the CC activity of a gene product, preferably enzymatic activity, carbon CC compound catabolism, biosynthetic, transporter, transcriptional, CC translational, signal transduction, DNA replication and cell division CC ability to inhibit growth or proliferation of C. albicans cells and for CC treating infection by C. albicans. The present sequence is that of a PCR CC primer used in the method of the invention. Note: The sequence data for CC this patent is not represented in the printed specification but is based CC on sequence information supplied to Derwent by the European Patent Office

  The invention relates to a method for the recombinant production and purification of a human vascular endothelial growth factor (VEGF) protein encoded by a polynucleotide originally obtained from human hepatocarcinoma tissue. The method involves the inducible expression of the VEGF protein in Escherichia coli, followed by protein extraction and affinity chromatography to yield high purity VEGF protein. The invention also relates to the isolation and cloning of the hepatocarcinoma-associated VEGF polynucleotide, and to the use of the recombinantly expressed VEGF protein or variants and derivatives thereof in the diagnosis or treatment of hepatocarcinoma. Sequences AEF40119-AEF40119 represent human VEGF PCR primers which are specifically claimed for

  (i) the autocrine and paracrine functions of IGF-II which promote tumour induced angiogenesis and tumour cell migration; and (ii) autocrine growth of tumour cells, possibly including induction of apoptosis. (I) may also function as ribozymes. (I) are used for inhibiting growth and metastasis of mammalian tumours, also: (i) for treatment of other proliferative diseases, e.g. atherosclerosis and psoriasis; (ii) when labeled, as probes for detecting IGF-II mRNA; and (iii) as molecular weight markers. (I) that bind to the 5'-untranslated region of the foetal transcript (the form present in tumour cells) should not affect the adult transcript. They are effective against drug-resistant tumours

   This invention describes a novel nucleic acid (I) encoding an interactor control the Fanconi anemia protein of complementation group A (FAA), described as FANCIP1. The products of the invention have antitumor and anticytopenia activity. The protein encoded by (I) interacts with FAA, and becomes part of the complex or signal transduction cascade that, when defective, results in Fanconi anemia. (I) is used to express the corresponding polypeptide (II) and this is used to express the corresponding polypeptide (II) and this is used to raise specific antibodies (Ab), or to identify compounds (A) that react with and/or alter regions of (II). Compositions containing (I), vectors or cells that contain (I), (II), Ab or (A) are used for diagnosis of disease associated with defective DNA repair, cell-cycle aberrations, cytopenia, tumorigenesis and/or tumor progression, or predisposition to the disorders, and to treat or prevent the diagnosed diseases, e.g. by gene therapy, Modified forms of (I) are useful as antisense sequences and ribozymes. This sequence represents a PCR primer used in the isolation of the invariance in the reactor protein FANCIP1 which is described in the method of

  The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals

  clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA ilbraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer used to amplify a human cDNA clone provided in the invention

   ABV7223-37 represent antisense oligonucleotides which are targeted to human insulin-like growth factor II (IGF-II) foetal mRNA. The oligonucleotides are complementary to the 5 untranslated region consisting of exons 4, 5 or 6 of human fetal IGF-II mRNA. The antisense oligonucleotides of the invention are useful for inhibiting the growth human tumour, where a chemotherapeutic agent is also administered. They are also useful for treating proliferative disorders including various forms of cancers, psoriasis, and atherosclerosis, as hybridisation prob to detect the presence of IGF-II mRNA in mammalian cells, and as molecular weight markers
   are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1936-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21922-1, which are specifically claimed for use in the present invention

                       Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha) gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human and/or mouse C/EBP alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels by quantitative real-time PCR. The C/EBP family of proteins are a family of transcription factors which regulate the expression of a wide range of genes that control normal tissue development, cellular function, cellular proliferation and functional differentiation. C/EBP beta (also known as C/EBPZ, LAP, TCPS, CRP2, NFIL6, IL69BP, NF-M, AGP/EBP and Apc/EBP)

  and is a mediator of II-6 (interleukin-6) signalling. C/EBP beta is thought to be involved in carbohydrate metabolism, immunity, the Th1 response, female fertility and gluconeogenic pathways. C/EBP beta is expressed in the liver, lung, spleen, kidney, brain, and testis, with the highest expression found in the lung. It is also expressed at a higher level in malignant ovarian tissue compared with normal ovarian tissue, and its expression in pancreas is upregulated in response to chronically elevated levels of glucose, indicating that it is involved in the impairment of insulin secretion in type II diabetes. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with C/EBP beta expression, such as cancer (particularly ovarian cancer), tumour formation, diabetes (particularly type II diabetes), infection, or inflammation

   abnormalities, e.g. myasthenia gravis, Eaton-Lambert disease, muscular dystrophy, amyotrophic lateral sclerosis, post-traumatic stress disorder (PTSD), multiple sclerosis, dystonia, post-stroke sclerosis, post-injury muscle damage, excessive re-innervation, post-surgery paralysis of unknown origin, or post-exposure to AchE inhibitors. The composition is also useful for improving stamina in physical exercise or in decreasing muscle fatigue. This is also useful for treating conditions affecting the central nervous system, where the BBB would normally impede their
  prevention of a progressive neuromuscular disorder, for improving stamina, and/or for use in chronic muscle fatigue. This composition facilitates the passage of compounds through the blood-brain barrier (BBB). It is useful for treating and/or preventing a progressive neuromuscular disorder, particularly a disorder associated with an excess of AChE mRNA or protein, an excess of acetylcholinesterase 'readthrough' variant or isoform (AchE-R) mRNA, or impairment of cholinergic transmission. The composition is also useful for treating muscle preventing a progressive neuromuscular disorder involving muscle distortion, muscle re-innervation or neuromuscular junction (NNJ)
  New composition comprising an the antisense oligodeoxynucleotide hEN101, useful for treating or preventing a progressive neuromuscular disorder, e.g. myasthenia gravis, Eaton-Lambert disease, muscular dystrophy or

SXCCCCCCCCCCCCCXSXATTTTXX
   Producing progeny of bacteriophages having genes encoding proteinaceous molecules allowing binding of the phage to Campylobacter spp, by contacting phage with Campylobacter mutant devoid of component present in the contacting phage with Campylobacter mutant devoid of component present
```

in

WPI; 2003-300898/29.

Example 1; Page 26; 66pp; English.

The present sequence is PCR primer LS16 for the Campylobacter jejuni wlak gene. LS16 was used in the construction of an insertional knockout mutant of the wlak gene of C. jejuni NCTC 1168. Mutagenesis of the gene was shown to disrupt binding by SBA lectin, and a role in protein glycosylation was indicated. The invention relates to methods for the detection, diagnosis and treatment or prevention of Campylobacter infections, especially in poultry. A method is provided for producing or selecting for progeny of phage comprising a nucleic acid encoding a protein allowing targeting or binding of the phage to Campylobacter spp. This involves contacting a phage library with a Campylobacter spp. mutant devoid of a surface component present in the wild-type, e.g. a glycosylated component. The phage can be used in the classification of a C. jejuni variant, and in a pharmaceutical composition for treating a Campylobacter infection

  This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that rare potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This oligonucleotide sequence is a human clone specific PCR primer used in an exemplification of the
  the metastasis of tumour. I growth factor II (IGF-II )

  amt. of a recombinant human interleukin-3 protein analogue, rhuIL-3, (Asp15,Asp70). The rhuIL-3 analogue has AA SQ in AAR09326. The compsn. may also comprise the N-terminal octapeptide in AAR09327, and a diluent and 1 or more than 1 biological response modifier. The compsn. has a biological specific activity of equal to or more than 4.0 x 10 to the 7 mcg/mg in a human bone marrow proliferation assay, and a binding affinity for human monocyte IL-3 receptors of equal to or more than 4.0 x 10 to the 10 (M to the minus 1). (Updated on 25-MAR-2003 to correct PA field.)
                     Probes were used in the isolation of human II-3, which was then expressed in a modified form, with a mutation in the N-glycosylation sites. The modified II-3 does not result in ulticaria or infiltration of mast cells and lymphocytes into the dermis. It stimualtes granulopoiesis,
  Compans. contg. recombinant non-glycosylated human interleukin-3 - has increased biological activity and binding affinity, for treating
     and lymphocytes into the dermis. It stimualtes granulopoiesis, erythropoiesis and thrombopoiesis in vivo and may used to treat

   PCR primers and probes AAZ61533-34 are used to amplify and identify human 5'OT-EST (oxytoxin expressed sequence tag) cDNA sequences. The 5'-OT EST gene is involved in the control of obesity and fertility in males. 5'-OT EST nucleic acids are useful for producing transgenic animals. The transgenic animals created serve as a model for human late onset obesity and other related disorders and are also used for identifying the genetic cause of obesity. Compounds which modulate 5'-OT EST expression or activity are useful in the treatment or modulation of late onset visceral obesity or male infertility particularly in the disorders related to these conditions such as wasting, or anorexia, or cachexia associated with prolonged illness, or malabsorptive states or catabolic states associated with other diseases such as inflammatory conditions, Crohn's disease or AIDS wasting, or burns, or cancer, or bone disease

  The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein encoding sequence. The present sequence is available on WIPOWEB and is not in the specification.

  The present invention relates to a novel pharmaceutical composition comprising: (a) an agent capable of modulating an expression level or grotein activity of a cancer-related transmembrane protein (CRTP) or gene; an antibody specific for a CRTP, or a T cell activated by a CRTP; and (b) a carrier. The pharmaceutical composition may also comprise a polymucleotide capable of inhibiting or decreasing the expression of the CRTP by RNA interference or an antisense mechanism. The CRTPs of the invention are selected from ABCC4, C2000rf103, CACNAID, CDH6, CST, ENPP3, FLJ11855, GPR54, HAVCR1, SLC6A3, SLC30A4, TRG, and TRMM4. The pharmaceutical composition is useful for treating cancer, e.g. colon cancer, stomach cancer, breast cancer, prostate cancer, liver cancer, kidney cancer, stomach cancer, and esophageal cancer. The present sequence is a target oligonucleotide from one such CRTP for which short interfering RNAs (siRNA) were produced. Note: The sequence data for this patent did electronic format directly from WIPO at flow was obtained in celectronic format directly from WIPO at

The invention relates to a method of identifying the nucleotide for each of a set of single nucleotide polymorphisms (SNPs) in the major CC histocompatibility complex (MHC) region in a population of individuals, CC comprising providing the HLA type for the individuals and identifying an CC SNP haplotype in the population that correlates with the HLA type, where CC the SNP haplotype comprises the SNPs in the MHC region. The invention CC also relates to a method of predicting the HLA type of an individual, a CC method of determining the presence or absence of an allelic variant of an CC MHC gene in an individual, a method of identifying an SNP haplotype that CC correlates with susceptibility to a disease or condition, and a method of condition. The disease or condition and a method of condition selected from inflammatory bowel disease, ulcerative colitis, CC condition selected from inflammatory bowel disease, ulcerative colitis, CC myasthenia gravis, vitiligo, Graves disease, Hashimoto's disease, gastritis, autoimmune hepatitis, dermatomy. Systemic CC purpus erythematosus, systemic sclerosis, polymyositis, dermatomyositis, pernicious anemia, primary biliary cirrhosis, idiopathic thrombocytopenia cCC purpura, Sjoegren's syndrome, multiple sclerosis, Reiter's syndrome and

  Primers HuQPS1.Forw1 (AAT72472) and pJOS2.T7 (AAT72473) are respectively complementary to exon A (see also AAT72462) and fragment Y (see also AAT72462) and fragment Y (see also AAT72462) of the human CII-3 gene that encodes a subunit (AAW21674) of complex II of the human mitochondrial electron transport chain. They were used to amplify genomic DNA from HeLa cells, hamster B9 cells, hamster XMW5.1.1(+) cells containing a complete human chromosome 1, XMW5.1.1(-) cells, and hamster XEWB.2.3 cells contg. mammalian artificial chromosome MACB.2.3. A PCR product of expected size (1.05 bp) was obtd. from HeLa, XMW5.1.1(+) and XEWB.2.3 cell DNA, indicating that cloned human genomic CII-3 sequences are present on chromosome 1, including the portion of chromosome 1 comprising MACB.2.3
   psoriasis. This sequence represents a human locus-specific oligonucleotide used in the scope of the invention.

determining from a structure of RNA istructure hybridized to another part Generating an oligonucleotide for treating diseases, comprises in the structure RNA from an exon, a region that assumes a part of the RNA and a region that is not

Example 1; Page 89; 117pp; English.

CC oligonuclectide is complementary to a consecutive part of 14-50 confidence of the RNA. It also comprises RNA, where the RNA contains a CC modification, preferably a 2'-0-methyl modified ribose (RNA) or CC deoxyribose (DNA) modification. The pre-mRNA comprising the exon exhibits cundesired splicing in a subject. The absence of the exon from mRNA CC produced from the pre-mRNA generates a coding region for a protein. The gene from which the RNA comprising the exon is transcribed encodes an CC gene from which the RNA comprising the exon is transcribed encodes an CC gene (COLGA1), a myocubular myopathy 1 gene (DMD), a collagen VI alpha 1 (C gene (COLGA1), a myocubular myopathy 1 gene (MPMI), a dysferlin gene (DYSF), a laminin-alpha 2 gene (LAMA2), an emery-dreyfuss muscular CC dystrophy gene (EMD), and/or a calpain 3 gene (CAPN3). Preferably, the gene is the DMD gene. The oligonucleotide, its equivalent, or the compound is useful for at least in part altering recognition of the exon CC exons in a pre-mRNA; for the preparation of a medicament for the cc treatment of an inherited disease; for inducing exon skipping in a pre-mRNA; for altering exon-recognition in a pre-mRNA; for altering the efficiency with which a splice donor or splice acceptor sequence is used by a splicing machinery; for inducing exon-skipping of two, three, or correct exons in a pre-mRNA, or for inducing skipping of the at least two exons and a sequence located between the att exon exons (intervening sequence) on the pre-mRNA, where intervening sequence further comprises coligonucleotides (ADNs) used to study targeted skipping of 15 different common exons. Sequences ADS73865-ADS73903 represent antisense The invention relates to generating an oligonucleotide and involves determining from a secondary structure of RNA from an exon, a region assumes a structure that is hybridised to another part of the RNA (cl structure) and a region that is not hybridize in the structure (open structure), and subsequently generating an oligonucleotide, where at least a part of the oligonucleotide is complementary to the closed structure and at least another part of the oligonucleotide is complementary to the open structure. In generating an oligonucleotide the open and closed structures are adjacent to each other. The oligonucleotide is complementary to a consecutive part of 14-50 In generating an oligonucleotide, h, a region that the RNA (closed

  The invention relates to antisense oligonucleotides targeted to human PARP nucleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells or tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative

  The present invention relates to novel tumour necrosis factor receptors (TNFR) proteins and their encoding nucleic acids. The invention is usefu for treating and preventing inflammatory disorders such as inflammatory bowel disease, encephalitis, atherosclerosis and psoriasis, autoimmune disorders such as systemic lupus erythematosus, arthritis, multiple sclerosis, Crohn's disease and autoimmune encephalitis, graft vs. host disease (GVHD), allergy and asthma. The invention is also useful in gene therapy. The present sequence is human TNFR-6alpha amplifying RT-PCR primer. The primer is used in the exemplification of the invention.

XSSSSSSSSSSXXX
   The invention comprises a method of prophylaxis therapy for myocardial infarction. The method involves selecting a human subject susceptible to myocardial infarction by screening for a genetic variation in either the 5-lipoxygenase activating protein (FLAP) gene or the leukotriene A4 hydrolase (LTA4H) gene. The method further involves administration of a therapeutic agent and monitoring at least one inflammatory marker in the subject before and during the prophylaxis treatment. The method of the invention is useful for prophylaxis therapy for myocardial infarction. The present DNA sequence represents a PCR primer that was used to amplify a microsatellite marker from within the human FLAP gene.

Sequencing complex genomes, present as fragments in a cosmid library - sequencing end-specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes. with Ьy

WPI; 1995-036508/05

Example 4; Page 75; 128pp; English.

Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning. A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the complete sequences and elemented based maps, and ultimately, for the AAQ82001-Q82706 for STS primers. (Updated on 25-MAR-2003 to correct PN

   specific application is diagnosis of copper toxicosis (CT). The inventic can also be used to create a genetic map of the canine genome; to generate breed-specific profiles; to establish paternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be done at any time in the dog's life. The present sequence is that of a PCR primer of the invention.

The invention relates to corneodesmosin protein (I) and nucleic acid (II)
CC encoding the corneodesmosin gene, where the gene comprises a base
CC substitution, deletion or insertion at one or more positions. (I) and
CC (II) are useful for screening for agents for use in prognosis, diagnosis
CC and treatment of individuals having or being susceptible to
CC corneodesmosin-mediated disease, by monitoring the reaction between the
CC molecules and the agents. The nucleotide and amino acid polymorphisms are
CC useful for diagnosing or determining susceptible to corneodesmosin-
CC mediated disease, which facilitates subsequent treatment of the disease
CC for e.g. inflammatory diseases, in particular psoriasis. Fragments of (I)
CC are useful in diagnostic, prognostic or therapeutic methods and as
CC research tools for e.g. in drug screening. (II) is useful as probes or
CC primers for detecting an allele of the polymorphism or in the regulation
CC of corneodesmosin gene. Antibodies which binds to (I) are useful for
CC screening DNA clone libraries for cells secreting the antigen. (II) is
CC useful as a model to investigate the role of corneodesmosin in normal
CC sequences, single nucleotide polymorphisms (SNPs) and PCR primers of the
conception.

. . . .

New composition comprises small interfering nucleic acid molecule (siNA) capable of reducing expression of a target gene that is active in a IgE-mediated disorder, useful for treating, e.g. allergic rhinitis or atopic dermatitis.

Disclosure; SEQ ID NO 169; 178pp; English.

The invention describes a composition comprising a small interfering C nucleic acid molecule (siNA) capable of reducing expression of a target CC gene that is active in a IgE-mediated disorder, a genetic construct that CC expresses the siNA, and a binding agent that specifically binds to a CC target antigen expressed on the surface of the cell. Also described are: C a method for the treatment of an IgE-mediated disorder in a patient; prevention of IgE-mediated disorder in a patient; CC prevention of IgE-mediated disorder in a patient, reduction of CC a specific antigen in a patient; and preventing or reduction of IgE-mediated immune response to a specific antigen in a patient. The composition CC is useful in the preparation of a medicament useful for the treatment of CC an IgE-mediated disorder, e.g. allergic rhinitis, asthma, anaphylaxis, CC urticaria, atopic dermatitis, food allergies, diseases that benefit from CC the reduction of eosinophila in the tissues of the respiratory system, CC or disorders having hypersensitivity immune reaction. This sequence CC represents a siNA for supression of human IgE expression.
